
IMESI

International Mutual Economic Security Instrument

Ministerial Brief

Version 10.0 | March 2026

Two-Page Summary for Ministerial Decision

FOR OPEN CIRCULATION

WHY THIS MATTERS NOW

Tariff shocks are accelerating. Supply chains are being weaponised. Great-power economic pressure is targeting sovereign policy decisions with increasing frequency and sophistication. The gap between what the WTO can address and what governments face in real time is widening every quarter. No country—large or small—is currently insured against coordinated economic coercion.

WHAT IMESI IS

IMESI is mutual economic security insurance. When one member is hit with coercive tariffs, supply-chain cutoffs, or financial exclusion, the others pool resources to stabilise the target and raise the cost to the coercer—making economic blackmail strategically irrational. Stabilisation is delivered through pre-defined payout bands linked to GDP impact and trade exposure, reducing ad-hoc bargaining over support.

Designed to stabilise mid-sized coercion events immediately and scale with membership to systemic shocks.

HOW IT WORKS — THREE THINGS TO REMEMBER

- Hours: Automatic stabilisation. Liquidity, swap lines, and supply-chain rerouting deploy within hours, within pre-authorised national exposure limits. No vote required. This is the insurance payout.
- Days: Political decisions. Your government votes on coordinated trade responses. You choose which measures to join, case by case. Full discretion preserved.
- Months: Accountability. All escalated measures expire automatically at 120 days. Independent reviews at 90 days force active decisions. Renewal requires fresh affirmative votes each cycle—no automatic rollover.

WHAT IT IS NOT

Not a trade bloc. Not a military alliance. Not a sanctions-coordination body. Not a regulatory harmonisation project. Your government keeps full control of trade policy, bilateral relationships, alliance memberships, and domestic regulation. Any parliament can reject any measure at any time.

WHAT IT COSTS

Annual contributions scale by GDP: large economies ~0.06–0.08%, mid-size ~0.03–0.05%, small states ~0.01–0.02%. Hard annual ceiling: 0.25% of GDP, all calls included. A "lite" option at 0.15% GDP is available for governments with fiscal constraints. Peacetime benefits—procurement savings of 10–18%, early-warning intelligence, supply-chain access—begin from Month 1 and typically exceed contributions.

WHO CONTROLS IT

You do. All countermeasures require a vote of member governments. No single country can trigger, block, or control the process. An independent panel, drawn from non-member, rotating, multi-regional experts, publishes a public assessment of every activation within 72 hours. Your parliament retains the right to reject any measure. A mandatory 5-year independent audit by non-member experts ensures the system stays accountable.

WHAT YOU GET FROM DAY ONE

- Early-warning intelligence identifying coercive threats 30–90 days before they hit.
- Joint procurement savings on energy, pharmaceuticals, and critical minerals.
- Alternative settlement and payment channels—including CBDC-ready infrastructure.
- Supply-chain mapping and rerouting capability activated before any crisis.
- Coercion Risk Dashboard signalling credible collective backing to investors and markets.

These are not crisis tools. They deliver returns in peacetime. The insurance is a bonus.

WHY MOVE NOW

Founding members shape the rules, set the precedents, and receive enhanced protection: 1.5x Fund access, heightened response presumptions, and guaranteed seats on key bodies. A Minimum Viable Coalition of just 6 governments at 15% of global GDP can bring the system into operation. The first version covers tariffs and basic liquidity only—the politically lightest possible scope. Broader powers activate only after a 5-year review and a 70% supermajority vote.

THE PATTERN THIS IS BUILT FOR

Sudden discriminatory tariffs after policy disagreements. Abrupt export restrictions on critical inputs during diplomatic disputes. Financial-system access used as leverage in unrelated political issues. Regulatory harassment targeting firms from specific countries. Coordinated economic pressure timed to elections and treaty negotiations. These patterns are documented, recurring, and accelerating. IMESI is calibrated specifically against them.

NEXT STEPS — NO COMMITMENT REQUIRED

1. Exploratory briefing. Designate one senior official to attend an informal, no-commitment scoping session at the next G7, OECD, or WTO ministerial margins. Nothing is signed. Nothing is announced.
2. Tabletop pilot. Consider joining a low-risk, 6-month tabletop exercise with 3–5 other willing governments. It is a simulation—no treaty obligations, no financial commitments, no public exposure. Your officials run through a scenario using real trade data and report back.
3. Impact assessment. Request a confidential, tailored Accession Impact Note from the IMESI Secretariat showing what membership would mean for your specific economy—contributions, exposure, and benefits—in numbers your finance ministry can model.

There is no binding financial or political downside to saying yes to any of these steps. Each is exploratory, confidential, and reversible. The only risk is doing nothing while the economic security landscape continues to deteriorate.

This brief summarises IMESI v10.0 (March 2026). Full framework (234 pages), condensed version (101 pages), ministerial digest (4 pages), FAQ (40 questions), and red-team scenario booklet (12 exercises) are available on request.
